# Storage limits for Cloud Volumes ONTAP 9.7 in GCP

Cloud Volumes ONTAP has storage configuration limits to provide reliable operations. For best performance, do not configure your system at the maximum values.

## Maximum system capacity by license

The maximum system capacity for a Cloud Volumes ONTAP system is determined by its license. The maximum system capacity includes disk-based storage plus object storage used for data tiering. NetApp doesn't support exceeding this limit.

For the Premium and BYOL licenses, disk limits prevent you from reaching the 368 TB capacity limit by using disks alone. You can reach the 368 TB capacity limit by [tiering inactive data to object storage](#). Refer to the disk limits below for more details.

License	Maximum system capacity (disks + object storage)
Explore	2 TB (data tiering is not supported with Explore)
Standard	10 TB
Premium	368 TB
BYOL	368 TB per license

## Disk and tiering limits

The table below shows the maximum system capacity with disks alone, and with disks and cold data tiering to object storage. The disk limits are specific to disks that contain user data. The limits do not include the boot disk and root disk.

Parameter	Limit
Maximum disks per system	124
Maximum disk size	16 TB
Maximum system capacity with disks alone	256 TB
Maximum system capacity with disks and cold data tiering to a Google Cloud Storage bucket	<ul style="list-style-type: none"><li>• Premium: 368 TB</li><li>• BYOL: 368 TB per license</li></ul>

## Aggregate limits

Cloud Volumes ONTAP groups Google Cloud Platform disks into *aggregates*. Aggregates provide storage to volumes.

Parameter	Limit
Maximum number of data aggregates	99 <sup>1</sup>
Maximum aggregate size	96 TB of raw capacity <sup>2</sup>
Disks per aggregate	1-6 <sup>3</sup>
Maximum number of RAID groups per aggregate	1

Notes:

1. The maximum number of data aggregates doesn't include the root aggregate.
2. The aggregate capacity limit is based on the disks that comprise the aggregate. The limit does not include object storage used for data tiering.
3. All disks in an aggregate must be the same size.

## Logical storage limits

Logical storage	Parameter	Limit
<b>Storage virtual machines (SVMs)</b>	Maximum number for Cloud Volumes ONTAP	One data-serving SVM and one destination SVM used for disaster recovery. You can activate the destination SVM for data access if there's an outage on the source SVM. <sup>1</sup>  The one data-serving SVM spans the entire Cloud Volumes ONTAP system.
<b>Files</b>	Maximum size	16 TB
	Maximum per volume	Volume size dependent, up to 2 billion
<b>FlexClone volumes</b>	Hierarchical clone depth <sup>2</sup>	499
<b>FlexVol volumes</b>	Maximum per node	500
	Minimum size	20 MB
	Maximum size	Dependent on the size of the aggregate
<b>Qtrees</b>	Maximum per FlexVol volume	4,995
<b>Snapshot copies</b>	Maximum per FlexVol volume	1,023

Notes:

1. Cloud Manager does not provide any setup or orchestration support for SVM disaster recovery. It also does not support storage-related tasks on an additional SVM. You must use System Manager or the CLI for SVM disaster recovery.
  - [SVM Disaster Recovery Preparation Express Guide](#)
  - [SVM Disaster Recovery Express Guide](#)

2. Hierarchical clone depth is the maximum depth of a nested hierarchy of FlexClone volumes that can be created from a single FlexVol volume.

## iSCSI storage limits

iSCSI storage	Parameter	Limit
<b>LUNs</b>	Maximum per node	1,024
	Maximum number of LUN maps	1,024
	Maximum size	16 TB
	Maximum per volume	512
<b>igroups</b>	Maximum per node	256
<b>Initiators</b>	Maximum per node	512
	Maximum per igroup	128
<b>iSCSI sessions</b>	Maximum per node	1,024
<b>LIFs</b>	Maximum per port	1
	Maximum per portset	32
<b>Portsets</b>	Maximum per node	256
